PREFACE

This publication presents economic multipliers and supply ratios for the Alberta economy calculated using the 2010 Alberta Treasury Board and Finance Input-Output (I/O) model. Information is provided for both the Open (direct and indirect impacts) and Closed (direct, indirect and induced impacts) forms of the model. Economic impacts are presented for the Alberta economy only.

The tables used in this publication are derived from the 2010 inter-provincial I/O tables released by Statistics Canada in November 2013.

Custom Impact Analysis

In addition to this publication, Alberta Treasury Board and Finance maintains a highly disaggregated I/O model at the detailed confidential level, which covers 235 industries and 481 commodities. The model may be used to simulate directly both Open and Closed impacts, where additional precision or more detailed output is required than is presented in this publication. To make the model more descriptive of changing economic conditions, the commodity structure can also be customized to client specifications.

The I/O model has a tax module that provides impacts on federal, provincial and local tax revenues, as well as the number of jobs required for any given impact.

Inquiries concerning this publication or requests for simulations using the 2010 Alberta Input-Output model should be directed to:

INTRODUCTION

Measuring Production in the Economy

The most commonly known measure of production in the economy is Gross Domestic Product (GDP). GDP captures the value of goods and services produced for final domestic consumption, export or investment. In other words, it covers only final, unduplicated output. For example, the value of a good or service sold by Industry A to Industry B, which in turn is used in Industry B's production process for sale into final demand, is not directly recorded in GDP. Industry A's output is not counted directly because it is implicitly included in the value of output of Industry B when it is sold into final demand. Including Industry's A output would result in double-counting of its contribution to the overall economy. To avoid this problem, in calculating GDP, goods or services are valued only at the point where they are sold into final domestic demand (i.e., to households for consumption; to business for investment; or to government for current or capital expenditure) or when they are exported.

In other words, in measuring GDP, the value of goods and services consumed during the production process (referred to as intermediate consumption) is not captured. While the GDP method ensures that there is no duplication, very useful information concerning the flow of goods and services among the various industries in an economy is not revealed.

To better reflect these linkages in the economy, it is necessary to use another valuation method called total output. Total output captures the value of goods and services for final consumption or export, plus those that are consumed during the production process (referred to as intermediate inputs). This is the focus of Input-Output (I/O) analysis.

The System of National Accounts

Statistics Canada has developed a comprehensive accounting framework, the System of National Accounts (SNA), that provides the tools to analyze production from both a value-added GDP and I/O perspective.

The SNA enables us to measure the value of goods and services in the economy, including the flow of commodities to final demand sectors; the cost of primary inputs to industries; and the value added by industries.

There are four key statistical components of the SNA:

- I/O tables, which summarize the total output of commodities by industry and the use of commodities by industries. They reflect the flow of commodities between industries and to final demand sectors; the value added by industry; and the cost of primary inputs to industries. In this way, the I/O tables describe the activity of production in the economy.
- Income and expenditure accounts, which focus on income generated by productive activity and final expenditure on that production. It is from these tables that the common measure of GDP is calculated. Estimates of Alberta GDP can be found in the income and expenditure accounts of the Alberta Economic Accounts.
- Financial flow and national balance sheet accounts, which focus on capturing transactions in assets and liabilities for a number of institutional sectors. The financial flows accounts reveal the financing of economic activity.
- Balance of payments and international investment position, which are devoted entirely to transactions with non-residents or the rest of the world in the economy.

The SNA recently underwent a historical (comprehensive) revision, which entails the incorporation of conceptual, classification, presentational and major statistical changes. As a result, the lists of industries and commodities presented in this publication will differ from those in editions prior to the 2009 economic multipliers.

For more detailed discussion on the SNA, please go to the Statistics Canada website, System of National Economic Accounts www.statcan.gc.ca/nea-cen/index-eng.htm.

THE INPUT-OUTPUT MODEL

What are I/O Models?

Input-Output (I/O) models use the information from I/O tables to capture the interdependence of industries and reflect the flow of goods and services through the economy. The main purpose of I/O models is to do impact analysis, measuring how changes in industry output or final demand for commodities impact the economy in terms of total output, GDP, employment, labour income and government revenue.

I/O analysis has its foundations in the analytical framework developed by Wassily Leontief in the late 1930s. In its most basic form, an I/O model consists of a system of linear equations that represent how various industries' commodities are distributed throughout the economy.

I/O models are based on tables that describe the flow of commodities through the economy from producers in one industry to another industry, and to final demand. The table below represents a simplified I/O framework:

Table 1: Simplified I/O Accounting Framework

	Industries	Net Final Demand	Total Output
Industries	F	Y	X
Value added (Primary Inputs)	V		
Total Input	X		

Source: UN Handbook of Input-Output Table Compilation and Analysis, 1999

The industries on top are consuming sectors, while the industries down the side are supplying sectors. Matrix F maps out the flow of commodities from the supplying sectors to the consuming sectors, including other industries and final demand entities. Total input is the sum of the inputs supplied by industries and any value added (other non-industrial inputs to production like labour, profit, indirect taxes and depreciation of capital). Total output is the sum of output consumed by industries in the production process (represented in row on top), plus net final demand. Theoretically, the total value of output in the economy equals the sum of its inputs (Total Input X = Total Output X).

From this table, fixed-coefficient linear production functions can be developed that represent the proportion of commodities being supplied and consumed by each industry. These coefficients

are the backbone of I/O analysis because they represent how changes in input or output will impact the entire economy.

Table 1 represents a basic I/O model; in practice, I/O models have been developed to incorporate the effects of inter-regional trade flows, employment, taxes and other variables.

I/O Impacts and Model Closure

The impacts generated through I/O models can be separated into direct, indirect, and induced:

- Direct impacts are those first-level impacts resulting from a shock or change in demand, to either industry output or final demand. They refer to the direct impact on those industries that must respond to satisfy the change in demand for commodities.
- Indirect impacts are secondary, and are generated from the linkages between industries. They refer to the impacts on industries that supply intermediate inputs to the industries directly impacted by the shock.
- Induced impacts capture the income effect of the shock. They measure the impact of additional consumption from spending the wages generated by the shock. For example, when there is an increase in final demand, industries have to increase production. They hire additional people, who receive wages. It is assumed that these households, after withdrawing a portion of their income for savings and taxes, spend the rest of their income on consumer goods and services. This creates an additional multiplier effect on the economy.

Calculating GDP

The three methods for calculating GDP can be applied using the I/O framework above.

1. The value-added approach, which is the sum of value added for all industries (subtracting purchases from other businesses from the total value of output);
2. The income approach, which adds up all the factor incomes generated in the production process (for example, labour and profits);
3. The final expenditure approach, which is the sum of all sales to end users, including exports net of imports.

Open vs. Closed

The impact of spending by final demand categories can be considered external to an I/O model because decisions about spending come from factors outside the model, such as availability, personal preference, etc. This means that the final demand by these entities is taken as given, and is unrelated to the level of production by industries in the model. In this type of model, which is referred to as an "Open" I/O model, direct and indirect impacts are measured, while induced are not.

In reality, there is a link between households and the production process through labour and wages, represented by the induced impacts. In this case, the household sector is endogenous to the model and treated as a production sector. The input of the household sector is consumer expenditure on goods and services, while output is labour income (consisting of wages and salaries, supplementary labour income and labour income of unincorporated sector). An I/O model which makes households endogenous is referred to as a "Closed" model. I/O models can also be "closed" to other factors such as government sales and purchases, but closure to households is the most common. In this type of model, all three impacts are measured: direct, indirect and induced.

Closing an I/O model to households increases the interdependence of the system and results in a higher impact on the variables of the model, leading to multipliers of a larger magnitude than those based on the Open version. The Closed model has been criticized because it introduces a bias in favor of those economic projects with a higher labour content. For example, consider the case where two projects have the identical purchased inputs and the same level of direct GDP, but where one project has a higher proportion of labour income and the other a higher proportion of operating surplus (e.g., corporation profits). For this case, the Closed model will estimate a larger economic impact for the project with the higher proportion of labour income (other things being equal). This result occurs because the model has been "closed" to household spending but not to profits, and the induced impacts estimated by the model are related to the level of household income rather than profits. Care should be exercised when interpreting Closed model results.

Limitations of I/O Models

I/O analysis is based on various assumptions about the economy and the linkages among industries and commodities. While I/O models are a very useful tool in the decision-making process, users should be aware of the caveats and limitations when applying them:

- ♦ The relationship between industry inputs and outputs is linear and fixed, meaning that a change in demand for a commodity or for the outputs of any industry will result in a proportional change in production. The model cannot account for economies/diseconomies of scale or structural changes in production technologies, an assumption which does not necessarily hold in the actual economy.
- ♦ Prices are fixed in the model.
- ♦ I/O models reflect industry averages for technology use and average input costs. For these and other reasons, an I/O model will not provide a totally complete or absolute measure of the impact of economic change.
- ♦ I/O models are static and do not take into account the amount of time required for changes to happen.
- ♦ There are no capacity constraints, and all industries are operating at capacity. This implies that an increase in output results in an increase in demand for labour (rather than simply re-deploying existing labour). It also implies that there is no displacement that may occur in existing industries as new projects are completed.

The structure and limitations of I/O models lend themselves to measuring the impacts of projects that are shorter term in nature; generally, they are used to look at shocks to the economy. For longer-term, time series analysis, general equilibrium models are more appropriate.

The Alberta I/O Model

Alberta Treasury Board and Finance has developed an I/O model for the Alberta economy based on the structure of Statistics Canada's inter-provincial model. Although the Alberta model accounts for the interaction of imports and exports on the Alberta economy (both inter-provincial and international), the Alberta model provides impacts for Alberta only. The model has the capacity to run impact analysis on industry expenditures, output and changes in final demand.

The key inputs to the model are the Alberta I/O tables, produced annually by Statistics Canada through the SNA. The I/O tables consist of the output, use and final demand matrices. The output matrix is a table that shows the value of goods and services produced by each industry; the use matrix shows the makeup of the inputs needed for each industry to produce its output; and the final demand matrix shows final consumption of goods and services. Using these tables, it is possible to produce a system similar to the one outlined in Table 1.

Provincial I/O tables are available publicly at the "Summary" level of aggregation, while national I/O tables are available at the "Detailed" aggregation level. I/O tables at the "Detailed Confidential" level of aggregation are provided to provinces exclusively

through data-sharing agreements. This level provides the most granular data available, covering 235 industries, 481 commodities and 278 final demand categories. The Alberta I/O model is based on "Detailed Confidential" level data, but analysis can be done at the "Summary" aggregation level, as well as two intermediate aggregation levels, "Link 1961" and "Link 1997".

The Alberta model has a tax module that provides impacts on federal, provincial and local tax revenues. The model also estimates the number of jobs required for any given impact. There is also the ability to do customized runs for different tax and wage scenarios.

A "Safety Net" feature was added to the model in 2011. This feature allows for the assumption that a certain number of jobs required for a change in output of a project will come from people who are receiving employment insurance. When this new feature is activated, the induced impacts resulting from a project will be less since at least a portion of the new jobs are filled by people previously receiving employment insurance. This means that the amount of additional income earned is lower than if those employees had not been receiving employment insurance benefits. This publication includes both Closed model results without a "Safety Net" and Closed model values with this feature activated.

ALBERTA ECONOMIC MULTIPLIERS

The most common application of I/O models is economic multipliers, which are generated by the I/O model for industries and commodities. Economic multipliers capture the impact of shocks to the economy on output, labour income, employment and GDP. They enable users to do impact analysis without getting into the detailed analysis associated with the I/O models.

Limitations of I/O Multipliers

Economic multipliers are subject to the same caveats and limitations of I/O models. This includes the caveats associated with fixed prices, production technology and capacity. In addition, there are several other things to keep in mind when using multipliers:

- Multipliers are specific to regions and economies. The multipliers in this publication are for the Alberta economy, and thus cannot be used to estimate impacts for other regions. This includes other regions within Canada or smaller regions within Alberta.
- The size and interpretation of a multiplier depend on how it is defined. There are multipliers that measure the impact on gross output while others measure GDP, which is often more desirable because GDP multipliers eliminate the double-counting of expenditures (or benefits). It may be tempting to use the multiplier that gives the largest impact, but this may not be the most appropriate multiplier.
- Impacts reflect the structure of the economy and industry linkages at a point in time, i.e., 2010. If these linkages have changed, the calculation of the impacts in another year (e.g., 2014) will be less valid. Generally, the more removed the year of analysis from the year of the multipliers, the greater the limitations.
- Since I/O models are static, the multipliers do not give any indication about the time it takes for changes to happen.

Alberta Multiplier Structure

Open vs. Closed Multipliers

There are two main kinds of multipliers: Open and Closed. Open multipliers reflect only direct and indirect effects, whereas Closed multipliers consider induced impacts in addition to direct and indirect effects. Results from both the Open and Closed (to households) models are presented in this publication. This approach allows users to use both versions for

the purposes of analysis and to judge for themselves where the inclusion of induced impacts is warranted or advisable.

Simple/Total Multipliers and Type I/II Multipliers

The Open multipliers presented in this publication are expressed in two forms: as Simple multipliers and as Type I multipliers. The Closed version of these multipliers are called Total multipliers and Type II multipliers respectively. In this publication, Simple / Total multipliers are arranged by industry and by commodity, whereas Type I/II multipliers are arranged by industry only.

(Please note that in editions prior to the current publication, Simple/Total multipliers were called "Intensity Ratios", while Type I/II multipliers were labeled "Industry Multipliers". The revision of terminology was done in order to be more consistent with the terminology employed by Statistics Canada. No change, however, was made in their methodology.)

Simple/Total multipliers, whether by industry or by commodity, are calculated by dividing the total economic impact by the change in output. For example, if an industry increases its output by \$5.0 million and this leads to an increase of \$4.0 million in Alberta GDP, the multiplier value would be 0.80 (i.e., 4.0 divided by 5.0).

Type I/II multipliers are calculated by taking the total impact observed for a change in an economic variable and dividing it by the direct change. For example, if 100 jobs directly attributable to an industry (direct employment) correspond to 180 jobs (total employment) in the economy overall, the industry employment multiplier would be 1.8.

Simple/Total multipliers require only information on gross output or expenditure to calculate the suite of economic impacts, whereas Type I/II multipliers have to be applied to the direct change in the economic indicator of interest. Thus, Simple/Total multipliers are the form of multiplier that most users typically utilize since they generally know the direct change in revenue or expenditure, but do not know the direct change in the other economic indicators that they are interested in analyzing.

Basic and Purchaser Prices

Simple/Total multipliers by commodity are presented at both basic and purchaser prices. Data that are measured at basic prices reflect the price received directly by the producer of the commodity.

For example, this corresponds to the "farm gate" price in agriculture or the price received directly by a producing establishment in manufacturing.

Data at purchaser prices reflect the price paid by the final users of the commodity. This price, in addition to the price received by the producer of the commodity, reflects other costs such as the price of transportation from the producer to the final seller; wholesale and retail mark-ups; and commodity indirect taxes. These other costs, which are added to basic prices to derive purchaser prices, are referred to as margins. The model treats these margins as if they were purchased directly by the purchaser of the final good.

Commodity Supply Ratios

Most commodities that are consumed in Alberta, either as intermediate inputs or through final demand, are not 100 percent produced in Alberta. Often a portion is imported from other parts of Canada or the rest of the world. Table 13, Alberta Commodity Supply Ratios, summarizes the proportion of the supply that comes from within and outside Alberta for each major commodity group. For example, according to the table, 73.7 percent of forestry products and services (code: M11E0) are produced in Alberta, while 22.1 percent come from the rest of Canada and 4.2 percent come from the rest of the world.

The multipliers presented in this publication reflect the impact of output only produced in Alberta. This means that in the case where a commodity is purchased, the total value of the purchase must be adjusted to reflect the value of output from Alberta before the multiplier is applied. An example is outlined below for a \$1,000,000 increase in the demand for live animals (M112A):

- 75.6% of live animals come from Alberta.
Total value = \$1,000,000 * 75.6% = \$756,000
- The GDP impact = \$756,000 * 0.572 = \$432,432

Application of the Alberta Multipliers

Due to the limitations of the I/O model, it is unlikely that many of the assumptions and caveats associated with the multipliers would hold fully in the real world. It is important to understand the limitations and apply the multipliers in a reasonable way.

The most common application of multipliers is to estimate the economic impact associated with the establishment of a new firm, or the expansion of existing firms (or firm closure/contraction). In these cases, it is preferable to use economic multipliers

for relative, rather than absolute, comparisons. This means that while economic multiplier analysis may be used to determine which activity has the largest economic impact, it should not be used to estimate the absolute impact of any single activity. Where multipliers are used to estimate the impacts of a single activity, the results should be treated as general estimates only and not as absolute values.

Projects that rely more on locally produced commodities generate higher impacts than those that rely primarily on imports. The greater the linkages between an industry and other parts of the economy, and the greater the value of these linkages, the larger the industry's multiplier.

The I/O model is largely based on Statistics Canada's I/O tables, several of which are presented in current dollars only. Therefore, since the I/O model describes the Alberta economy in 2010, it is highly recommended to adjust all dollar values to 2010 prices using appropriate price deflator(s), such as the Consumer Price Index, in order to better capture the actual volumes of commodities associated with the impacts.

When using the employment multipliers, users are cautioned that these multipliers show the total number of jobs that are required to support the change in activity being considered, but does not indicate the number of new jobs created. When the economy is running at full employment, it is important to remember that the number of jobs required for a particular project must come from other projects/industries or from outside the province. As indicated above, the I/O model assumes unlimited capacity, whereas in reality, there is a limited number of people in the workforce. Please note that all employment impacts referenced throughout this document are measured in person-years.

The industry multipliers in this publication are at the "Link 1961" level of aggregation, while the commodity multipliers are provided at the "Summary" level. For more detailed impact analysis that considers industries or commodities at a more granular level, it may be necessary to do a custom run through Alberta Treasury Board and Finance.

Some of the limitations may be overcome by using an updated industry input structure based on more current data, and subjecting this revised information to a computer simulation using the I/O model developed by Alberta Treasury Board and Finance. If users wish to exercise this option, they should contact Alberta Treasury Board and Finance directly.

DESCRIPTION OF ECONOMIC MULTIPLIER TABLES

In this publication, economic multipliers are presented for GDP at basic prices, labour income, employment and total output. Below is a brief description of each of the tables contained in this publication and how they should be used. Tables 1 to 4 present results from the Open model, Tables 5 to 8 present results from the Closed model without a Safety Net, and Tables 9 to 12 present results from the Closed model with a Safety Net activated. Table 13 presents commodity supply ratios for Alberta.

For simplicity, all dollar values below are at 2010 prices.

Table 1: Simple Multipliers By Industry

Open Model

Table 1 presents Simple Multipliers by industry that measure the direct and indirect effects on the Alberta economy due to a change in output for each of the 107 major industries.

The impacts on GDP, labour income and gross production are expressed as impacts per dollar of output change, while employment impacts are expressed as the number of jobs per \$10,000 of output.

Example:

If there was a \$1 million increase in the output of the Residential Building Construction industry (code: BS23A00), the economic impacts would be as follows:

- The impact on GDP at basic prices:
 $0.663 * \$1,000,000 = \$663,000$.
- The impact on labour income:
 $0.492 * \$1,000,000 = \$492,000$.
- The impact on employment required:
 $\$1,000,000 / \$10,000 * 0.068 = 6.8$ jobs.
- The impact on total output:
 $1.461 * \$1,000,000 = \$1,461,000$.

Table 2: Type I Multipliers

Open Model

Table 2 consists of multipliers (direct and indirect) for industries. To use these multipliers, the user must know the direct increase in GDP at basic prices, labour income and the direct number of jobs for which the economic impacts are being analyzed.

- To use the GDP multiplier, the direct GDP content associated with some change in output must be known or calculated. The components of direct GDP at basic prices are those items which make up labour income, net taxes on production and a firm's operating surplus (profits, depreciation, etc.). The GDP multiplier is applied to this value.
- To use the labour income multiplier, the direct increase in wages, supplementary labour income and labour income of unincorporated sector must be known or estimated. The labour income multiplier is then applied to this value.
- The employment multiplier is expressed in terms of total number of jobs per direct job. For example, if a firm in Residential Building Construction industry (code: BS23A00) was established and employed 100 people directly, a total of $100 * 1.527 = 152.7$ jobs would be required (i.e., 100 direct jobs, plus an additional 52.7 indirect jobs). Please note that the multiplier does not distinguish between employee and self-employed jobs.
- The output multiplier is expressed in terms of total gross production per dollar of direct production.

Table 3: Simple Multipliers By Commodity at Basic Prices

Open Model

Table 3 presents multipliers for the direct and indirect effects on the Alberta economy due to a change in output for each of the 62 commodity groups.

The impacts on GDP and labour income are expressed as impacts per dollar of output change, while employment impacts are expressed as the number of jobs per \$10,000 of output. Table 3 presents results calculated for data at basic prices.

Example:

If output of live animals (code: M112A) increased by \$10 million in Alberta, the economic impacts would be as follows:

- The impact on GDP at basic prices:
 $0.589 \times \$10,000,000 = \$5,890,000$.
- The impact on labour income:
 $0.361 \times \$10,000,000 = \$3,610,000$.
- The impact on employment required:
 $\$10,000,000 / \$10,000 \times 0.101 = 101.0$ jobs.
- The impact on output:
 $2.389 \times \$10,000,000 = \$23,890,000$.

Table 4: Simple Multipliers By Commodity at Purchaser Prices

Open Model

Table 4 is analogous to Table 3 except that it presents results for data at purchaser prices.

Table 5: Total Multipliers By Industry

Closed Model

Table 5 is analogous to Table 1, except that it presents results for the closed model, which includes induced impacts in addition to the direct and indirect effects.

Table 6: Type II Multipliers

Closed Model

Table 6 is analogous to Table 2 except that it presents results for the closed model, which includes induced impacts in addition to the direct and indirect effects.

Table 7: Total Multipliers By Commodity at Basic Prices

Closed Model

Table 7 is analogous to Table 3, except that it presents results for the closed model, which includes induced impacts in addition to the direct and indirect effects.

Table 8: Total Multipliers By Commodity at Purchaser Prices

Closed Model

Table 8 is analogous to Table 4, except that it presents results for the closed model, which includes induced impacts in addition to the direct and indirect effects.

Table 9: Total Multipliers By Industry

Closed Model with Safety Net

Table 9 is analogous to Table 5, except that the results are presented with a "Safety Net" activated.

Table 10: Type II Multipliers

Closed Model with Safety Net

Table 10 is analogous to Table 6, except that the results are presented with a "Safety Net" activated.

Table 11: Total Multipliers By Commodity at Basic Prices

Closed Model with Safety Net

Table 11 is analogous to Table 7, except that the results are presented with a "Safety Net" activated.

Table 12: Total Multipliers By Commodity at Purchaser Prices

Closed Model with Safety Net

Table 12 is analogous to Table 8, except that the results are presented with a "Safety Net" activated.

Table 13: Commodity Supply Ratios

Percent

Table 13 shows the source of supply for commodities purchased in Alberta. The data is presented as a percent for Alberta, for the rest of Canada and for the rest of the world. This table indicates both the extent of "openness" of the Alberta economy and the degree to which the economy depends on imports. For example, 73.7% of forestry products and services (code: M11E0) purchased in Alberta were supplied by Alberta domestic production, 22.1% were imported from the rest of Canada, and 4.2% were imported from outside Canada.

APPLICATION OF ECONOMIC MULTIPLIERS

The following example shows how the multipliers are used. In this example, the goal is to analyze which of two projects will provide a greater economic impact on the Alberta economy.

In general, the information available to do the analysis will determine which multiplier is most appropriate to use. For the purposes of this example, the results are presented for the Open model only. The same calculations can be done using the appropriate Closed model tables.

For proper application of the multipliers, all dollar values should be adjusted to 2010 prices using appropriate price deflator(s). For simplicity, all dollar values below are presented at 2010 prices.

The following information is available:

Project 1: Construction of an establishment in the Wood Product Manufacturing Industry

The plant (establishment) will cost \$4 million (at basic prices) to build in 2014. A further \$1 million (at purchaser prices) will be spent purchasing industrial machinery. When in operation in 2015, the plant will provide 12 jobs and generate annual sales of \$3 million (at basic prices) with the distribution of costs outlined below. For simplicity, net taxes on production and products are ignored.

Project 2: Expansion of output by an establishment in the Wholesale Trade Industry

This project expands production by \$3 million (at basic prices) in 2014 and 2015.

Analysis of Project 1

To analyze the impact of Project 1, it is necessary to divide the project into two phases. The first phase occurs in 2014 and involves the effects of constructing the plant and purchasing the machinery. The second phase is the economic impacts of the yearly output of the plant beginning in 2015.

Construction Phase of Project 1:

For the impacts associated with the construction of the plant, the appropriate intensity ratios can be found in Table 1. In this case, the industry here is Non-Residential Building Construction (code: BS23B00).

The construction phase during 2014 would have the following effects:

- * The impact on GDP at basic prices:
 $0.644 * \$4,000,000 = \$2,576,000.$
- * The impact on labour income:
 $0.461 * \$4,000,000 = \$1,844,000.$
- * Employment required:
 $\$4,000,000 / \$10,000 * 0.062 = 24.8 \text{ jobs}.$

The impacts of purchasing the industrial machinery (M3330) in 2014 are estimated by using the appropriate intensity ratios in Table 4. Since a commodity is being purchased, Table 13 must be applied to account for the proportion of output coming from Alberta. According to Table 13, 22.2 percent of the industrial machinery purchased in Alberta is produced in the province, so the value of the machinery purchased must be adjusted to reflect this.

The calculated impacts due to machinery purchases are as follows:

- * Total value of Alberta machinery:
 $22.2\% * \$1,000,000 = \$222,000.$
- * The impact on GDP at basic prices:
 $0.464 * \$222,000 = \$103,008.$
- * The impact on labour income:
 $0.319 * \$222,000 = \$70,818.$
- * Employment required:
 $\$222,000 / \$10,000 * 0.042 = 0.9 \text{ jobs}.$

Alberta clearly derives more economic benefit from the construction activity associated with Project 1 than it does from the purchase of industrial machinery. This is partly due to the higher Alberta content for construction (i.e., local labour and materials) compared with machinery, which is predominately produced outside the province.

Operations Phase of Project 1:

The second phase of impacts associated with Project 1 involves the actual operation of the plant, which would begin operations in 2015. For this phase, the industry tables are used, since the impacts associated with the output of a particular industry are being analyzed. Since both the value of direct output and a breakdown of inputs has been given, either industry intensity ratios (Table 1) or industry multipliers (Table 2) can be used. To use Table 1, the procedure is to locate the appropriate industry and apply the ratios to the value of output. Here, information for the Wood Product Manufacturing industry (BS32100) is used, yielding the following impacts:

- ♦ The impact on GDP at basic prices:
 $0.648 * \$3,000,000 = \$1,944,000$.
- ♦ The impact on labour income:
 $0.446 * \$3,000,000 = \$1,338,000$.
- ♦ Employment required:
 $\$3,000,000 / \$10,000 * 0.063 = 18.9$ jobs

Since detailed cost information has been provided, the industry multipliers provided in Table 2 can also be used. The first step is to analyze the categories for which cost information has been provided and identify which of these enter into the establishment's operating surplus and thereby directly into GDP at basic prices. As a rule, wages, profits and depreciation are primary inputs (not purchased from another industry) and go directly into GDP. If overhead consists of salaries for administration (as is assumed in this case), this category also enters directly into GDP. Materials and other purchased inputs are not considered as direct GDP since they are purchased from other industries and involve indirect economic impacts.

Therefore, the cost categories can be allocated as follows:

	(000s)	
Wages	\$ 825	Direct GDP
Profit	\$ 100	Direct GDP
Depreciation	\$ 200	Direct GDP
Overhead	\$ 25	Direct GDP
Subtotal	\$ 1,150	Direct GDP
Materials	\$ 1,850	Indirect Output
Total	\$ 3,000	

Thus, \$1,150,000 out of the firm's \$3 million gross output constitutes its direct contribution to GDP at basic prices.

Included in this contribution is an estimated \$850,000 (\$825,000 + \$25,000) of direct labour income and 12 direct jobs to which the appropriate multipliers from Table 2 (Wood Product Manufacturing, code: BS32100) would be applied. The impacts are below, based on Table 2:

- ♦ The impact on GDP at basic prices:
 $1.698 * \$1,150,000 = \$1,952,700$.
- ♦ The impact on labour income:
 $1.575 * \$850,000 = \$1,338,750$.
- ♦ Employment required:
 $1.558 * 12.0 \text{ direct jobs} = 18.7 \text{ jobs}$.

In this example, the results using multipliers from Table 2 are similar to those calculated using the intensity ratios from Table 1. In practice, the multipliers from Table 2 should be used in preference to the intensity ratios from Table 1. Intensity ratios assume an "average" direct contribution to labour income, GDP at basic prices and employment; these factors can vary significantly from industry averages for particular firms. Generally, a more accurate result can be obtained by using actual data for firms and Type I (or II) multipliers rather than the industry averages implied in the Simple (Total) multipliers. However, to use Table 2, one must already know the direct impacts on GDP.

Analysis of Project 2

The only information provided for Project 2 is that output will increase by \$3 million at 2010 prices in both 2014 and 2015 for an establishment in the Wholesale Trade industry (code: BS41000). Since only industry data on output have been provided, one of the industry tables must be used (Table 1 or 2). As there is no breakdown of costs provided, multipliers from Table 1, rather than the multipliers from Table 2, must be used.

The \$3 million change in the value of output is applied to each multiplier, yielding the following total impacts:

- ♦ Impact to GDP at basic prices:
 $0.844 * \$3,000,000 = \$2,532,000$
- ♦ Impact on labour income:
 $0.514 * \$3,000,000 = \$1,542,000$
- ♦ Employment required:
 $\$3,000,000 / \$10,000 * 0.072 = 21.6$ jobs required.

Since the output is the same for 2014 and 2015 (i.e., \$3 million), the impacts would be the same for both years.

Comparison of the Two Projects

The last step in the analysis is to compare the results of the two projects. The following is a summary of the results (note that for Project 1, we have to combine the impacts of the construction activities and the industrial machinery purchases to get total impact for 2014):

	Project 1	Project 2
GDP (\$000s):		
2014	2,679	2,532
2015	1,953	2,532
Labour Income (\$000s):		
2014	1,915	1,542
2015	1,339	1,542
Employment (Jobs):		
2014	25.7	21.6
2015	18.7	21.6

It is clear that Project 1 has the larger economic impact for 2014. This result is largely due to the construction phase of the plant. If a longer term view is taken, then Project 2 may in fact yield the larger economic benefit. This can be seen by comparing impacts for 2015, for which Project 2 has a greater effect on GDP, labour income and employment.

It must be remembered that when the economy is in a phase of full employment, an increase in resources in one project may draw resources from other industries, reducing the overall impact. Furthermore, the multipliers used in the above examples reflect the structure of the economy and industry linkages in 2010. If these linkages were to have changed materially by 2014 or 2015, the impacts calculated above will be less valid.

Notes: Type I/II multipliers for GDP expressed as total impact per direct change in GDP.

Type I/II multipliers for Labour Income expressed as total impact per direct change in Labour Income.

Type I/II multipliers for total Output expressed as total impact per direct change in output.

Type I/II multipliers for Employment expressed as total jobs required per direct job required.

Please note that all employment impacts are measured in person-years.

You must know the direct change in GDP at basic prices, labour income or number of direct jobs required before using these multipliers. *Includes labour income of the unincorporated sector.

Notes: Type I/II multipliers for GDP expressed as total impact per direct change in GDP.

Type I/II multipliers for Labour Income expressed as total impact per direct change in Labour Income.

Type I/II multipliers for total Output expressed as total impact per direct change in output.

Type I/II multipliers for Employment expressed as total jobs required per direct job required.

Please note that all employment impacts are measured in person-years.

You must know the direct change in GDP at basic prices, labour income or number of direct jobs required before using these multipliers. *Includes labour income of the unincorporated sector.

Notes: Type I/II multipliers for GDP expressed as total impact per direct change in GDP.

Type I/II multipliers for Labour Income expressed as total impact per direct change in Labour Income.

Type I/II multipliers for total Output expressed as total impact per direct change in output.

Type I/II multipliers for Employment expressed as total jobs required per direct job required.

Please note that all employment impacts are measured in person-years.

The direct change in GDP at basic prices, labour income or number of direct jobs required must be known before using these multipliers. *Includes labour income of the unincorporated sector.

Notes: Simple/Total multipliers for GDP, Labour Income and total Output expressed as total impact per dollar of output change. Simple/Total multipliers for employment expressed as total number of jobs required per \$10,000 of output change. Please note that all employment impacts are measured in person-years. *Includes labour income of the unincorporated sector.

Industry Concordance: "Link 1961" ↔ "Detailed"

"Link 1961" Industry Title	"Link 1961" Codes	"Detailed" Industry Codes
Crop and animal production	BS11A00	BS111A00, BS111400, BS112000
Forestry and logging	BS11300	BS113000
Fishing, hunting and trapping	BS11400	BS114000
Support activities for agriculture and forestry	BS11500	BS115A00, BS115300
Oil and gas extraction	BS21100	BS211113, BS211114
Coal mining	BS21210	BS212100
Metal ore mining	BS21220	BS212210, BS212220, BS212230, BS212290
Non-metal mineral mining and quarrying	BS21230	BS212310, BS212320, BS212392, BS21239A, BS212396
Support activities for mining and oil and gas extraction	BS21300	BS21311A, BS21311B
Electric power generation, transmission and distribution	BS22110	BS221100
Natural gas distribution, water, sewage and other systems	BS221A0	BS221200, BS221300
Residential building construction	BS23A00	BS23A000
Non-residential building construction	BS23B00	BS23B000
Transportation engineering construction	BS23C10	BS23C100
Oil and gas engineering construction	BS23C20	BS23C200
Electric power engineering construction	BS23C30	BS23C300
Communication engineering construction	BS23C40	BS23C400
Other engineering construction	BS23C50	BS23C500
Repair construction	BS23D00	BS23D000
Other activities of the construction industry	BS23E00	BS23E000
Animal food manufacturing	BS31110	BS311100
Sugar and confectionery product manufacturing	BS31130	BS311300
Fruit and vegetable preserving and specialty food manufacturing	BS31140	BS311400
Dairy product manufacturing	BS31150	BS311500
Meat product manufacturing	BS31160	BS311600
Seafood product preparation and packaging	BS31170	BS311700
Miscellaneous food manufacturing	BS311A0	BS311200, BS311800, BS311900
Soft drink and ice manufacturing	BS31211	BS312110
Breweries	BS31212	BS312120
Wineries and distilleries	BS3121A	BS3121A0
Tobacco manufacturing	BS31220	BS312200

APPENDIX 1

"Link 1961" Industry Title	"Link 1961" Codes	"Detailed" Industry Codes
Textile and textile product mills	BS31A00	BS31A000
Clothing and leather and allied product manufacturing	BS31B00	BS31B000
Wood product manufacturing	BS32100	BS321100, BS321200, BS321900
Pulp, paper and paperboard mills	BS32210	BS322100
Converted paper product manufacturing	BS32220	BS322200
Printing and related support activities	BS32300	BS323000
Petroleum and coal products manufacturing	BS32400	BS324110, BS3241A0

APPENDIX 2

"Detailed" Industry Codes	"Detailed" Industry Title	NAICS 2007 Definition	Previous Naics 2002 Code
BS311100	Animal food manufacturing	3111	3111
BS311200	Grain and oilseed milling	3112	3112
BS311300	Sugar and confectionery product manufacturing	3113	3113
BS311400	Fruit and vegetable preserving and specialty food manufacturing	3114	3114
BS311500	Dairy product manufacturing	3115	3115
BS311600	Meat product manufacturing	3116	3116
BS311700	Seafood product preparation and packaging	3117	3117
BS311800	Bakeries and tortilla manufacturing	3118	3118
BS311900	Other food manufacturing	3119	3119
BS312110	Soft drink and ice manufacturing	31211	312110
BS312120	Breweries	31212	312120
BS3121A0	Wineries and distilleries	31213, 31214	312130, 312140
BS312200	Tobacco manufacturing	3122	3122
BS31A000	Textile and textile product mills	313, 314	31A
BS31B000	Clothing and leather and allied product manufacturing	315, 316	315110, 315190, 315210, 315220, 315230, 315290, 3159, 3161, 3162, 3169
BS321100	Sawmills and wood preservation	3211	3211
BS321200	Veneer, plywood and engineered wood product manufacturing	3212	3212
BS321900	Other wood product manufacturing	3219	3219
BS322100	Pulp, paper and paperboard mills	3221	3221
BS322200	Converted paper product manufacturing	3222	3222
BS323000	Printing and related support activities	323	323
BS324110	Petroleum refineries	32411	324110
BS3241A0	Petroleum and coal products manufacturing (except petroleum refineries)	324 excl. 32411	324120, 324190
BS325100	Basic chemical manufacturing	3251	3251
BS325200	Resin, synthetic rubber, and artificial and synthetic fibres and filaments manufacturing	3252	3252
BS325300	Pesticides, fertilizer and other agricultural chemical manufacturing	3253	3253
BS325400	Pharmaceutical and medicine manufacturing	3254	3254
BS325500	Paint, coating and adhesive manufacturing	3255	3255
BS325600	Soap, cleaning compound and toilet preparation manufacturing	3256	3256
BS325900	Other chemical product manufacturing	3259	3259
BS326100	Plastic product manufacturing	3261	3261

APPENDIX 2

"Detailed" Industry Codes	"Detailed" Industry Title	NAICS 2007 Definition	Previous Naics 2002 Code
BS326200	Rubber product manufacturing	3262	3262
BS327A00	Non-metallic mineral product manufacturing (except cement and concrete products)	327 excl. 3273	327A
BS327300	Cement and concrete product manufacturing	3273	3273
BS331100	Iron and steel mills and ferro-alloy manufacturing	3311	3311
BS331200	Steel product manufacturing from purchased steel	3312	3312
BS331300	Alumina and aluminum production and processing	3313	3313
BS331400	Non-ferrous metal (except aluminum) production and processing	3314	3314
BS331500	Foundries	3315	3315
BS332100	Forging and stamping	3321	3321
BS332A00	Cutlery, hand tools and other fabricated metal product manufacturing	3322, 3329	3329
BS332300	Architectural and structural metals manufacturing	3323	3323
BS332400	Boiler, tank and shipping container manufacturing	3324	3324
BS332500	Hardware manufacturing	3325	3325
BS332600	Spring and wire product manufacturing	3326	3326
BS332700	Machine shops, turned product and screw, nut and bolt manufacturing	3327	3327
BS332800	Coating, engraving, heat treating and allied activities	3328	3328
BS333100	Agriculture, construction and mining machinery manufacturing	3331	3331
BS333200	Industrial machinery manufacturing	3332	3332
BS333300	Commercial and service industry machinery manufacturing	3333	3333
BS333400	Ventilation, heating, air-conditioning and commercial refrigeration equipment manufacturing	3334	3334
BS333500	Metalworking machinery manufacturing	3335	3335
BS333600	Engine, turbine and power transmission equipment manufacturing	3336	3336
BS333900	Other general-purpose machinery manufacturing	3339	3339
BS334100	Computer and peripheral equipment manufacturing	3341	3341
BS334200	Communications equipment manufacturing	3342	3342
BS334A00	Other electronic product manufacturing	3343, 3345, 3346	3343, 3345, 3346
BS334400	Semiconductor and other electronic component manufacturing	3344	3344
BS335100	Electric lighting equipment manufacturing	3351	335100
BS335200	Household appliance manufacturing	3352	3352
BS335300	Electrical equipment manufacturing	3353	3353
BS335900	Other electrical equipment and component manufacturing	3359	3359
BS336110	Automobile and light-duty motor vehicle manufacturing	33611	33611
BS336120	Heavy-duty truck manufacturing	33612	33612

APPENDIX 2

"Detailed" Industry Codes	"Detailed" Industry Title	NAICS 2007 Definition	Previous Naics 2002 Code
BS336200	Motor vehicle body and trailer manufacturing	3362	3362
BS336310	Motor vehicle gasoline engine and engine parts manufacturing	33631	336310
BS336320	Motor vehicle electrical and electronic equipment manufacturing	33632	336320
BS336330	Motor vehicle steering and suspension components (except spring) manufacturing	33633	336330
BS336340	Motor vehicle brake system manufacturing	33634	336340
BS336350	Motor vehicle transmission and power train parts manufacturing	33635	336350
BS336360	Motor vehicle seating and interior trim manufacturing	33636	336360
BS336370	Motor vehicle metal stamping manufacturing	33637	336370
BS336390	Other motor vehicle parts manufacturing	33639	336390
BS336400	Aerospace product and parts manufacturing	3364	3364
BS336500	Railroad rolling stock manufacturing	3365	3365
BS336600	Ship and boat building	3366	3366
BS336900	Other transportation equipment manufacturing	3369	3369
BS337100	Household and institutional furniture and kitchen cabinet manufacturing	3371	3371
BS337200	Office furniture (including fixtures) manufacturing	3372	3372
BS337900	Other furniture-related product manufacturing	3379	3379
BS339100	Medical equipment and supplies manufacturing	3391	3391
BS339900	Other miscellaneous manufacturing	3399	3399
BS411000	Farm product wholesaler-distributors	411	NA
BS412000	Petroleum product wholesaler-distributors	412	NA
BS413000	Food, beverage and tobacco wholesaler-distributors	413	NA
BS414000	Personal and household goods wholesaler-distributors	414	NA
BS415000	Motor vehicle and parts wholesaler-distributors	415	NA
BS416000	Building materials and supplies wholesaler-distributors	416	NA
BS417000	Machinery, equipment and supplies wholesaler-distributors	417	NA
BS418000	Miscellaneous wholesaler-distributors	418	NA
BS419000	Wholesale electronic Purchasers and agents and brokers	419	NA
BS441000	Motor vehicle parts dealers	441	NA
BS442000	Furniture and home furnishings stores	442	NA
BS443000	Electronics and appliance stores	443	NA
BS444000	Building materials and garden equipment and supplies dealers	444	NA
BS445000	Food and beverage stores	445	NA
BS446000	Health and personal care stores	446	NA
BS447000	Gasoline stations	447	NA
BS448000	Clothing and clothing accessories stores	448	NA
BS451000	Sporting goods, hobby, book and musical instruments stores	451	NA
BS452000	General merchandise stores	452	NA
